#### CS231n Convolutional Neural Networks for Visual

#### Recognition

In the previous assignment, you implemented and trained your own ConvNets. In this assignment, we will explore many of the ideas we have discussed in lectures. Specifically, you will:

- Reduce overfitting using dropout and data augmentation
- Combine models into ensembles to boost performance
- Use transfer learning to adapt a pretrained model to a new dataset
- Use data gradients to visualize saliency maps and create fooling images

# Setup

You can work on the assignment in one of two ways: locally on your own machine, or on a virtual machine through Terminal.

## Working locally

**Get the code:** Download the starter code here.

**[Optional] virtual environment:** Once you have unzipped the starter code, you might want to create a virtual environment for the project. If you choose not to use a virtual environment, it is up to you to make sure that all dependencies for the code are installed on your machine. To set up a virtual environment, run the following:

```
cd assignment3
sudo pip install virtualenv  # This may already be installed
virtualenv .env  # Create a virtual environment
source .env/bin/activate  # Activate the virtual environment
pip install -r requirements.txt # Install dependencies
# Work on the assignment for a while ...
deactivate  # Exit the virtual environment
```

You can reuse the virtual environment that you created for the first or second assignment, but you will need to run <code>pip install -r requirements.txt</code> after activating it to install additional dependencies required by this assignment.

**Download data:** Once you have the starter code, you will need to download the CIFAR-10 dataset, the TinyImageNet-100-A and TinyImageNet-100-B datasets, and pretrained models for the TinyImageNet-100-A dataset.

Run the following from the assignment3 directory:

NOTE: After downloading and unpacking, the data and pretrained models will take about 900MB of disk space.

```
cd cs231n/datasets
./get_datasets.sh
./get_tiny_imagenet_splits.sh
./get_pretrained_models.sh
```

**Compile the Cython extension:** Convolutional Neural Networks require a very efficient implementation. We have implemented of the functionality using Cython; you will need to compile the Cython extension before you can run the code. From the <code>cs231n</code> directory, run the following command:

```
python setup.py build_ext --inplace
```

**Start IPython:** After you have downloaded the data and compiled the Cython extensions, you should start the IPython notebook server from the <code>assignmen3</code> directory. If you are unfamiliar with IPython, you should read our IPython tutorial.

# Working on Terminal

We have created a Terminal snapshot that is preconfigured for this assignment; you can find it here. Terminal allows you to work on the assignment from your browser. You can find a tutorial on how to use it here.

### Submitting your work:

Whether you work on the assignment locally or using Terminal, once you are done working run the <code>collectSubmission.sh</code> script; this will produce a file called <code>assignment3.zip</code>. Upload this file to your dropbox on the coursework page for the course.

### Q1: Dropout and Data Augmentation

In the IPython notebook **q1.ipynb** you will implement dropout and several forms of data augmentation. This will allow you to reduce overfitting when training on a small subset of the CIFAR-10 dataset.

### Q2: TinyImageNet and Model Ensembles

In the IPython notebook **q2.ipynb** we will introduce the TinylmageNet-100-A dataset. You will try to classify examples from this dataset by hand, and you will combine pretrained models into an ensemble to boost your performance on this dataset.

## Q3: Transfer Learning

In the IPython notebook q3.ipynb you will implement several forms of transfer learning. You will use adapt a pretrained model for TinylmageNet-100-A to achieve reasonable performanc with minimal training time on the TinylmageNet-100-B dataset.

## Q4: Visualizing and Breaking ConvNets

In the IPython notebook q4.ipynb you will visualize data gradients and you will generate images to fool a pretrained ConvNet.
